Correlation Coefficient

• **Definition :** Write a program to implement (i) Pearson correlation and display heatmap 4 (ii) chi-square test

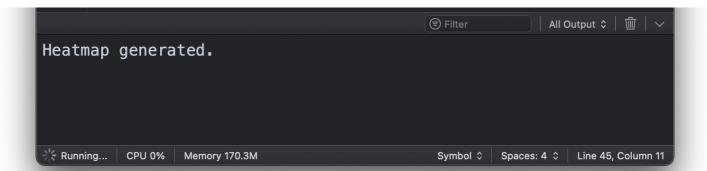

• Code:

```
1. from sklearn import datasets
2. import numpy as np
3. import seaborn as sb
4. import matplotlib.pyplot as plt
5.
6. # Loading the boston dataset in x and y
7. x , y = datasets.load boston(return X y=True)
8.
9. # Creating the List
10.data set = np.array(x[0:506,:])
11.
12.# Reshaping the 1-d array in 2-d array of 13 rows
13.data set = data set.reshape(13,506)
14.
15.x_mean = [ np.array(item).mean() for item in data set ] #
  Calulating the mean of all the 13 arrays and storing in the
  list
16.
17.data_val = []
18.for i in range(len(x mean)):
19.
      temp = []
20.
       for j in data set:
21.
          num = 0
22.
           den = 0
23.
           for k in range(len(j)):
```

2MA402 19BCE245

```
24.
                                                    num += (data_set[i][k]-x_mean[i])*(j[k]-
        np.array(j).mean())
25.
                                                     den += (((data_set[i][k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((j[k]-x_mean[i])**2)*((
        np.array(j).mean())**2))**0.5
                                      temp.append(num/den)
27.
                        data val.append(temp)
28.
29."""
30. In the above nested loop, I am calculating the the pearson
        coefficient for all the 13 arrays I have created before.
31. for all the 13 arrays.
32.Let i , j represent array[i] and array[j]
33.and matrix[i][j] represents the pearson coefficient for
        array i and array j
34.theefore, the pearson coefficient for matrix[i][j] =
        matrix[j][i]
35.and for j = i, the pearson coefficient for matrix[i][i] = 1
36."""
37.
38.# Plotting the heatmap of that matrix
39.heat map = sb.heatmap(data val,annot=True,cmap='Oranges')
40.plt.title("Heat Map")
41.plt.xlabel("X - Axis")
42.plt.ylabel("Y - Axis")
43.plt.show()
